

# Valutazione della Progressione

Prof.ssa Maria A Pantaleo

University of Bologna

IRCCS Pol. Sant'Orsola Malpighi Bologna

### **Approccio alla Valutazione della Progressione:**

- Imaging: TAC, RM, PET (focale, generalizzata)
- Clinica
- Biopsia tissutale

### **Trattamento:**

Progressione focale  
Progressione generalizzata

## New response evaluation criteria in solid tumours: Revised RECIST guideline (version 1.1)

*E.A. Eisenhauer<sup>a,\*</sup>, P. Therasse<sup>b</sup>, J. Bogaerts<sup>c</sup>, L.H. Schwartz<sup>d</sup>, D. Sargent<sup>e</sup>, R. Ford<sup>f</sup>,  
J. Dancey<sup>g</sup>, S. Arbuck<sup>h</sup>, S. Gwyther<sup>i</sup>, M. Mooney<sup>g</sup>, L. Rubinstein<sup>g</sup>, L. Shankar<sup>g</sup>, L. Dodd<sup>g</sup>,  
R. Kaplan<sup>j</sup>, D. Lacombe<sup>c</sup>, J. Verweij<sup>k</sup>*

**Table 1** Summary of major changes in RECIST 1.1 compared with RECIST 1.0

RECIST guideline	RECIST 1.1	RECIST 1.0
No. of target lesions	Up to 2 per organ; up to 5 in total	Up to 5 per organ; up to 10 in total
Assessment of LNs	Short-axis measurements should be used and recorded; $\geq 15$ mm, target lesions; $\geq 10$ mm but $< 15$ mm, non-target lesions: $< 10$ mm.non-pathological	No clear guideline provided
Clarification of disease progression	20% increase in the sum of target lesions and 5-mm absolute increase are required	20% increase in the sum of target lesions (no minimum absolute size increase) is required
FDG-PET scan	Included only in the detection of new lesions	Not included

RECIST 1.0, Response Evaluation Criteria in Solid Tumors guideline version 1.0; RECIST 1.1, Response Evaluation Criteria in Solid Tumors guideline version 1.1; LNs, lymph nodes; FDG, fluorodeoxyglucose; PET, positron emission tomography.

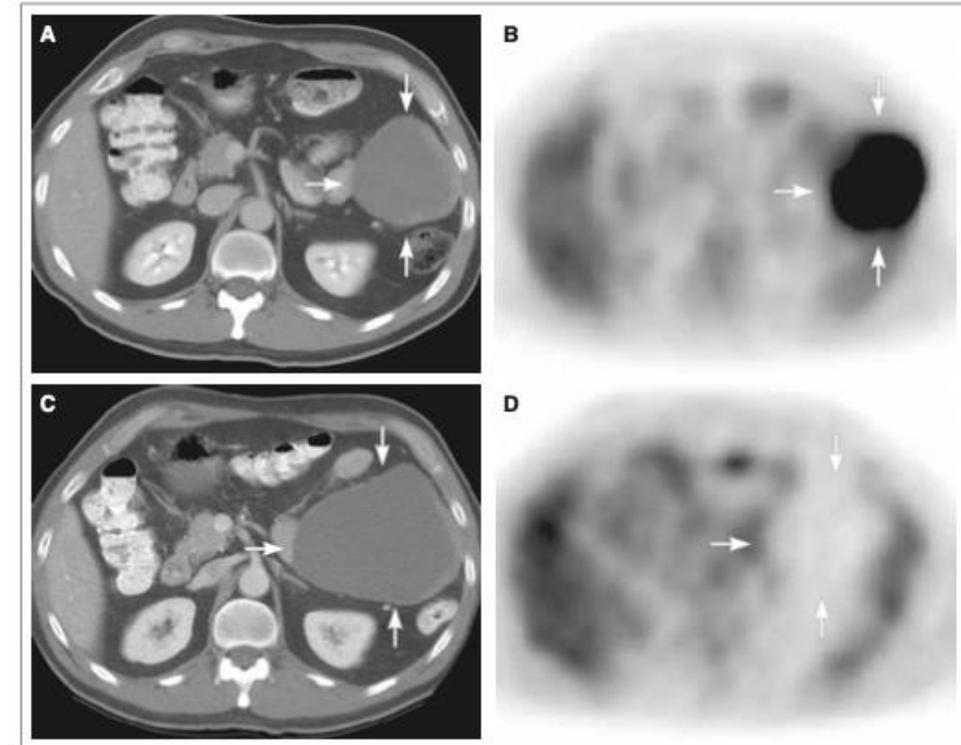

## Correlation of Computed Tomography and Positron Emission Tomography in Patients With Metastatic Gastrointestinal Stromal Tumor Treated at a Single Institution With Imatinib Mesylate: Proposal of New Computed Tomography Response Criteria

Haesun Choi, Chusrip Charusangavej, Silvana C. Faria, Homer A. Macapinlac, Michael A. Burgess, Shreyaskumar R. Patel, Lei L. Chen, Donald A. Podoloff, and Robert S. Benjamin

## Criteri di risposta nei tumori solidi (CHOI)

Table 3. Modified CT Response Evaluation Criteria	
Response	Definition
CR	Disappearance of all lesions No new lesions
PR	A decrease in size* of $\geq 10\%$ or a decrease in tumor density (HU) $\geq 15\%$ on CT No new lesions No obvious progression of nonmeasurable disease
SD	Does not meet the criteria for CR, PR, or PD No symptomatic deterioration attributed to tumor progression
PD	An increase in tumor size of $\geq 10\%$ and does not meet criteria of PR by tumor density (HU) on CT New lesions New intratumoral nodules or increase in the size of the existing intratumoral nodules

Abbreviations: CR, complete response; PR, partial response; HU, Hounsfield unit; CT, computed tomography; SD, stable disease; PD, progression of disease; RECIST, Response Evaluation Criteria in Solid Tumors.  
\*The sum of longest diameters of target lesions as defined in RECIST.<sup>10</sup>

**Fig 5.** A 51-year-old male with primary gastrointestinal stromal tumors of colon and recurrent peritoneal metastases. Pretreatment computed tomography (CT) scan shows (A) a relatively low-density peritoneal mass (42 Hounsfield units [HU]) (—) corresponding to (B) a lesion with markedly increased glucose uptake (—) on positron emission tomography using [<sup>18</sup>F]fluorodeoxyglucose (FDG-PET). At 2 months after treatment, (C) the mass (—) has become larger, however, the CT density has decreased (30 HU), (D) with no appreciable glucose uptake (—) on FDG-PET, corresponding to initial improvement. [Reprinted with permission.<sup>11</sup>]

# Early functional evaluation

$^{18}\text{F}$ FDG-Positron emission tomography for the early prediction of response in advanced soft tissue sarcoma treated with imatinib mesylate (Glivec<sup>®</sup>)

S. Stroobants<sup>a,\*</sup>, J. Goeminne<sup>b</sup>, M. Seegers<sup>b</sup>, S. Dimitrijevic<sup>c</sup>, P. Dupont<sup>a</sup>, J. Nuyts<sup>a</sup>, M. Martens<sup>b</sup>, B. van den Borne<sup>b</sup>, P. Cole<sup>c</sup>, R. Sciot<sup>d</sup>, H. Dumez<sup>b</sup>, S. Silberman<sup>c</sup>, L. Mortelmans<sup>a</sup>, A. van Oosterom<sup>b</sup>

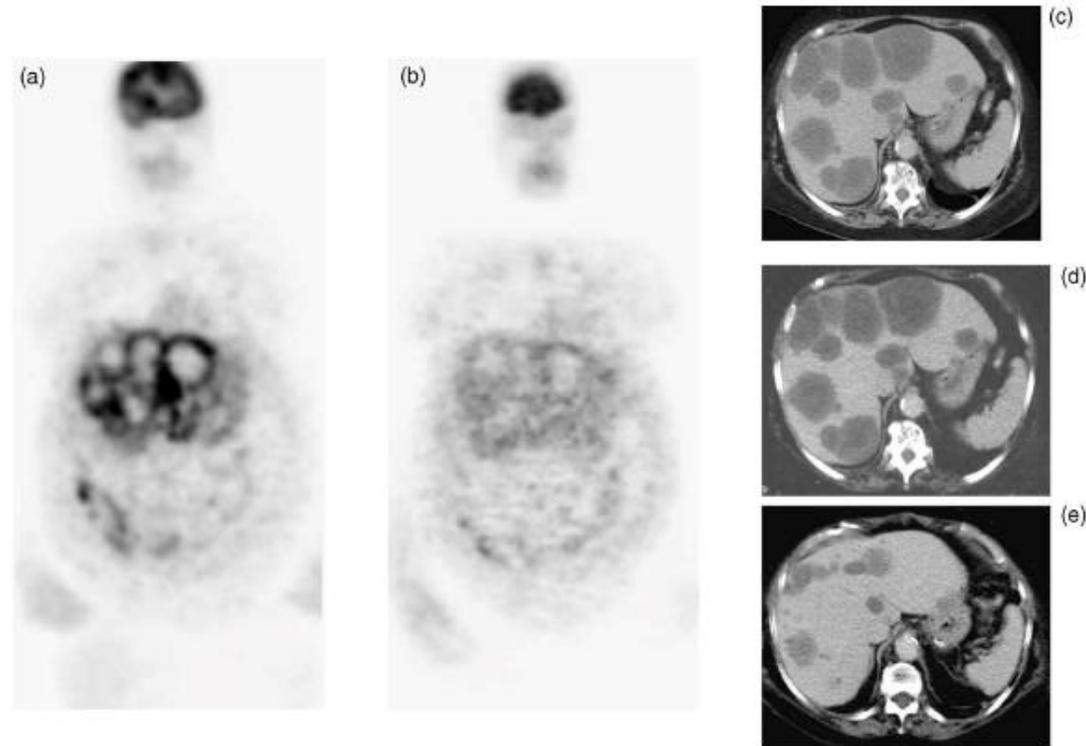

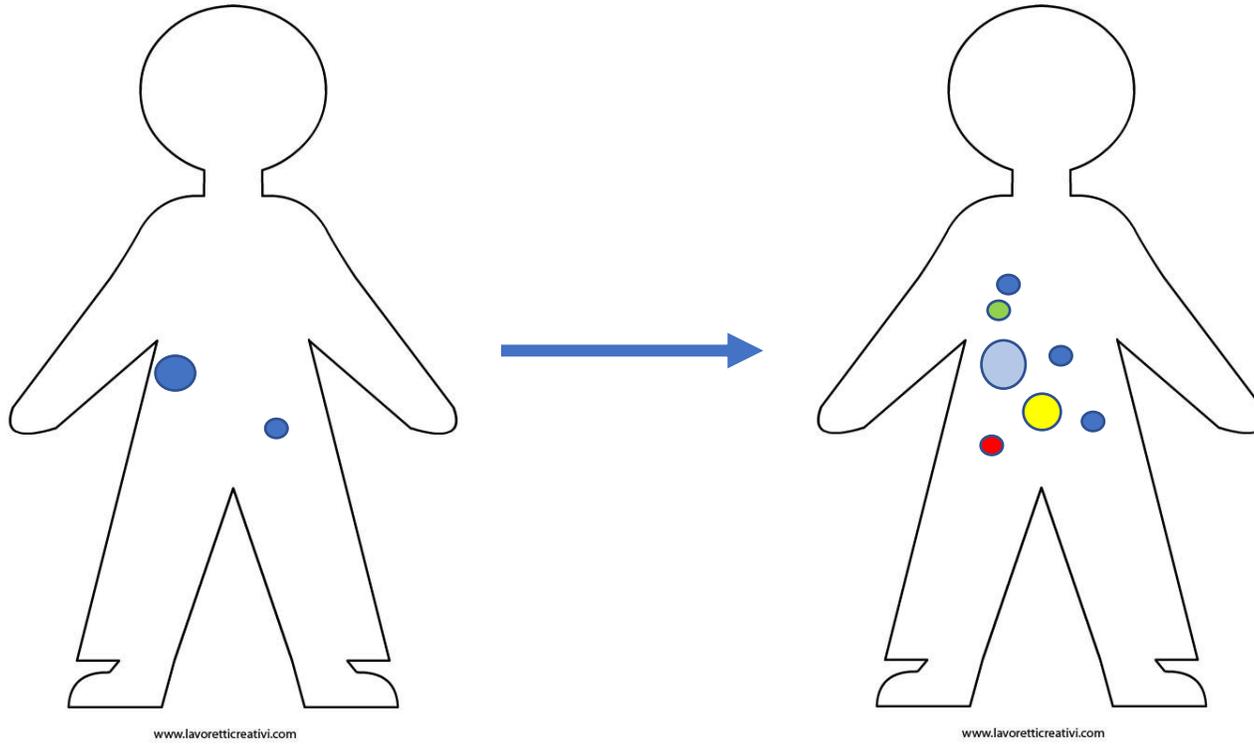

Fig. 3. GIST patient with multiple liver and peritoneal metastases prior to the start of treatment on positron emission tomography (PET) (a) and computerised tomography (CT) (c). A complete remission was achieved on PET 8 days after the start of imatinib treatment (b). On CT at 4 weeks, no major volume changes were observed (d). Only after 24 weeks of treatment (e) was an objective tumour response observed on CT.

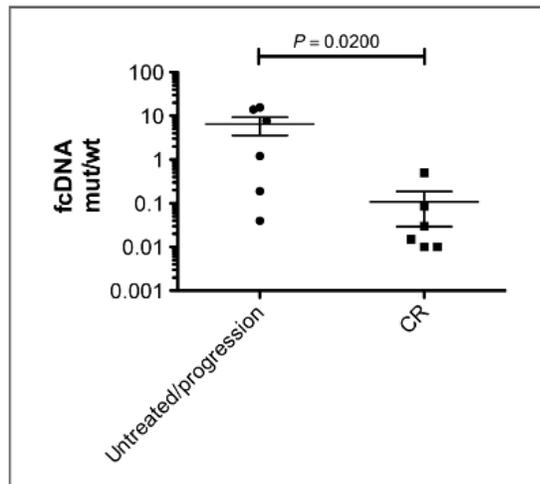

Figure 1. Correlation of mutant fcDNA and disease setting. Shown are the highest fcDNA mutant to wt (mut/wt) ratios measured for individual patients who were test-positive. Patients with untreated GIST or progressive disease (untreated/progression) versus patients in CR. There were no significant differences in mean follow-up ( $P = 0.8255$ ) and sample frequency ( $P = 0.8761$ ) between "untreated/progression" ( $n = 6$ ) and "CR" ( $n = 6$ ) groups.

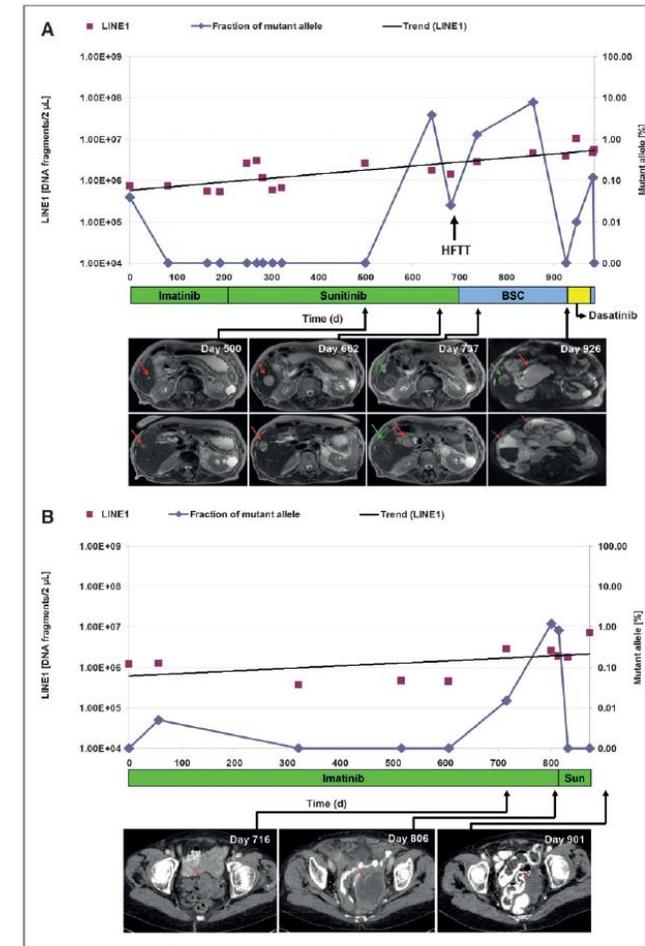

Figure 3. A–E, *LINE1* and mutant fcDNA in correlation with clinical response in individual patients over time. *LINE1* (long interspersed nuclear elements; left y-axis) reflects total fcDNA; mutant allele in percentage wt indicates the amount of mutant fcDNA (right y-axis). Treatments and results of imaging (MRI, CT, and FDG-PET/CT) are shown below the time line (x-axis). Patient numbers correspond to Fig. 2. A, patient 5 (age, 76 years; female), *CKIT* exon 9 insertion AY502-503 mutation (BSC, best supportive care). B, patient 7 (age, 75 years; female), *CKIT* exon 11 deletion Y553-Q556 mutation.

RECIST 1.1 response		Non-PD	PD
Count features (on the first follow-up CT scan) <ul style="list-style-type: none"><li>Expanded/intensified high-enhancement area</li><li>Progressive EVFDM</li></ul>	None	Non-mPD	mPD
	One	mPD	mPD
	Two	mPD	mPD

**Fig. 5** Modified RECIST (mRECIST) criteria according to multivariate regression. Lesions with the mPD classification included those with the RECIST PD or non-PD classification that exhibited at least one morphologic feature. mPD, modified progressive disease

# Conclusioni

- Ad oggi l'identificazione della PD è dipendente dall'esperienza del MMD
- Le scelte terapeutiche conseguenti andrebbero ponderate bene soprattutto nella progressione focale
- L'integrazione di terapie locoregionali e TKI è il futuro del trattamento dei GIST metastatici
- La biopsia liquida è molto promettente in ricerca clinica, enorme è ancora la discussione in pratica clinica
- Nuovi scenari della ricerca in radiologia sono in divenire
